CIVIL AVIATION AND THE ENVIRONMENT

Exposed population over IGW 1

Transport Carrier

Aviation generates noise emissions too. However, the number of people exposed, in relation to other transport carriers, is rather low.

Exceeding the emission limit value pursuant to LSV:

	Day	Night
Road	1'200'000	700'000
Railroad	70'000	140'000
Aviation	27'000	57'000

The noise-exposed area 2 around Zurich Airport has decreased over the last 20 years by two thirds, despite an increase in flight movements. At the same time, the population in the affected areas increased by 83%.

ENERGY / CO₂

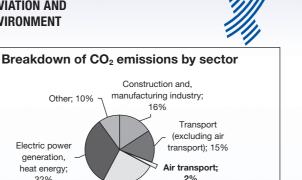

Around 2% of worldwide fossil energy consumption is assignable to civil air transport. This results in a share of about 2% of man-made CO₂ output3). Air transport contributes with approximately 12% of worldwide CO₂ emissions within the entire transport industry. Considering transport carriers in Switzerland, around 25% of all consumed fuel is used for continental and intercontinental flights.4) During an intercontinental flight a modern airliner consumes within a range of 100 km less than 3 litres of fuel per passenger

CLIMATE

According to the report "Aviation and the Worldwide Atmosphere" of UNEP and WMO (IPCC 1999)⁵, the worldwide air traffic contributes with 3.5%⁶ to the man-made greenhouse effect. With increasing air traffic that share could grow up to 5% by 2050. The state of scientific research on the impact of nitric oxides and water vapour arising from aircraft engines on the greenhouse effect still shows significant uncertainties. In the long-run the climatic influence will be dominated by the CO₂ emission. The latest scientific studies assume that based on an assessment period of 100 years these materials strengthen the greenhouse effect of CO₂ by the factor 1.35⁷. CO₂ emissions at cruise altitude have the same effect as ground-level emissions (e.g. road traffic, industry or heating). Approximately one third of the nitrogen oxide at cruising level originates from shipped ground-level emissions, from aircraft or has natural origins (thunderstorm).

CIVIL AVIATION AND THE ENVIRONMENT

The global aviation industry is engaged to further mitigate greenhouse gas emissions.

This engagement is based on four pillars:

Electric power

generation,

heat energy;

32%

Source: World Research Institute WRI

1st pillar: improved technology

Other: 10% ¬

(e.g. low-emission engines, lighter aircraft equipment, alternative fuels from waste and renewable resources)

Territorial gain

deforestation;

25%

- 2nd pillar: operational measures
- (e.g. shorter and more direct air routes, fuel-saving start and landing procedures)
- 3rd pillar: more efficient infrastructure (e.g. better use of airspace and airports)
- 4th pillar: economic measures (e.g. CO₂- offset, emission trading)

FMISSION TRADING

The Federal Council intends to subordinate Swiss aviation under the European Emission Trading System (EU ETS). A corresponding agreement was signed by the end of 2017. Its ratification is currently in the parliamentary consultation. It shall take effect from 1 January 2020 at the earliest. Similar to the existing regulation at European level all domestic flights and those within the European Economic Area (EEA) and Switzerland would be interlinked in this system.

ICAO decided at its most recent General Assembly to introduce the Carbon Offsetting and Reduction Schemes (CORSIA) that shall commit aviation to compensate for any CO₂ emissions exceeding the level of 2020.

Aviation generally supports the introduction of CORSIA. Regional measures such as EU ETS is rejected by the industry as they lead to competitive distortion and induced detour traffic outside of Europe.

¹⁾ Aviation Policy Report of Federal Council, 2016

Operation of a short- / medium-haul aircraft

- ²⁾ Economic significance of aviation in Switzerland, 1 June 2011, INFRAS
- The sum of direct and indirect effect corresponds to the (causally narrow) economic significance of aviation in Switzerland (incl. exports of aviation industry). The induced and catalytic effect illustrates, which further, causally less narrow, economic linkages aviation exhibits with the rest of the economy.
- 4) Incl. exports of aviation industry

Operation of a long-haul aircraft

Per million flight passengers 8)

- 5) Full Time Equivalents
- 6) Head Count SIAA and Sion Airport
- 7) Including aviation industry
- 8) Direct and indirect effects

In its report dated 24 February 2016 considering Swiss aviation policy, the Federal Council particularly emphasizes the great significance of civil aviation in Switzerland as well as the optimal international air traffic connections.

The airline traffic is explicitly recognised as part of the public transport. ¹⁾
On a value basis, up to 40% of all exports is forwarded by air freight. ¹⁾
30–35% of foreign tourists visit Switzerland by air. ¹⁾

Per capita basis, Switzerland is one of the countries with the most condensed air navigation demand in the world.

THE CONFEDERATION'S CIVIL AVIATION EXPENDITURES IN COMPARISON (CHFM)

	2016	201
Total expenditures federal government	66'261	68'288
whereof transport	9'104	9'053
whereof aviation 2)	185	178

The confederation's expenditures in favour of civil aviation are with 0.28% in 2016 and 0.26% 2017 in relation to the overall expenditures extremely modest.

With few exceptions no federal funds flow into the aviation sector. 1)

AIR TRAFFIC CONTROL

Skyguide, the Swiss incorporated limited company for civil and military air traffic control, coordinates and directs the air traffic of Switzerland and parts of neighbouring airspace. Skyguide is an enterprising and customer oriented private limited company owned by the federal government. Its running costs are covered by route and landing charges as well as statutory contributions of the federal government.

	2015	2016	2017

TRAINING CENTRES IN SWITZERLAND

Airfields across the entire country offer various opportunities getting trained in aviation activities and practice aviation sports. This task is provided by 141 flight training schools, 118 hang-gliding flight schools and more than 400 clubs.

Many dynamic companies offering qualified employment and access to several vocational training are located at domestic airfields.

THE SWISS AVIATION INDUSTRY

The aviation industry is the basis of an efficient aviation sector. It comprises development, manufacturing and maintenance companies overall employing around 12'850 people. The aviation industry's value added (direct effect) amounts up to CHF 1.9 billion. Including suppliers (indirect effect) staff number is increasing to 18'200 generating a value added of over CHF 2.8 billion. The aviation industry also includes ground handling and catering companies.

The largest direct economic value is achieved by the 60 EASA Part 21 and EN9100 manufacturing companies, which generate well over CHF 1 billion. They all manufacture and supply extremely innovative and technically demanding aircraft as well as systems, subassemblies and aircraft components in order to prevail towards foreign competitors.

¹⁾ Aviation Policy Report of Federal Council, 2016

The Swiss manufacturing companies enjoy an excellent reputation and are largely growing in their niche markets in spite of the strong Swiss Franc. In the subcategories such as light aircraft as well as unmanned aircraft and alternative rotor wing concepts new companies have been established. In the maintenance business the competitive pressure due to high wage costs and the strong Swiss Franc remains.

The increasing regulatory density at European level confronts the entire aviation industry with new major challenges that can only be mastered through innovative products and process improvements.

SWISS SPACE INDUSTRY

As a founding member of the European Space Agency (ESA), Switzerland was able to contribute to the European space activities from the very beginning. The Swiss space industry is an important partner in many European space projects.

The launch vehicles Ariane and Vega, the Satellite programmes Galileo, MetOp and Electra, the Space-Astronomy-Mission Cheops or the Sentinel-Satellites for Copernicus being Europe's global environmental and safety monitoring system, are just a few examples of important space projects in which Swiss manufacturers participate. In fact, there is hardly any current European mission that does not contain some kind of Swiss technology. To date, Switzerland is contributing to the ESA budget with ca. CHF 170 million per year. A large number of Swiss companies, universities and research institutes is engaged in ESA's earth observation programmes. The most important objectives from a Swiss perspective is the development of technological and industrial competencies in the field of sensor and instrument manufacturing as well as promotion of operational application of earth observation data. The emphasis of the Swiss space industry lies on the development and manufacturing of subsystems that become applicable in space. The range of products is broad and extends from payload fairings and structures to optical, mechanical and electronic components as well as scientific instruments and ground equipment. The payload fairings for the European launch vehicles Ariane 5 and Vega also originate from Switzerland as well as those for Ariane 6 and Vega C. Thanks to their extensive expertise and technologies, Swiss aerospace companies are successful in commercial space projects outside of European markets too. In the aggregate, the members of Swiss Space Industries Group (SSIG) achieve an annual turnover of ca. CHF 290 million. This corresponds to approximately 85% of revenues of the entire Swiss sector. Of the over 960 people being employed in space-related organisations, the majority has above-average qualifications. Around the half of all employed manpower in space has a university degree.
